

- As you remove the swab from tube, squeeze swab tip several times from outside of the tube. Try to release as much liquid from the swab as possible.
- Dispose of swab in trash.
- Insert the tip into the extraction tube tightly.

SPECIMEN TRANSPORT AND STORAGE

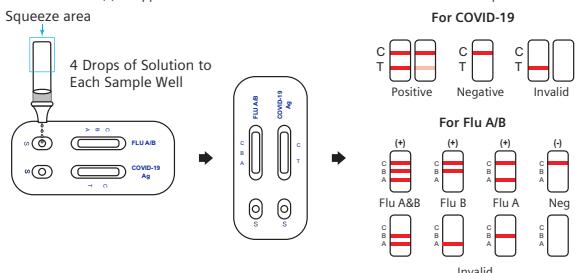

Do not return the nasopharyngeal swab to the original paper packaging.

For best performance, direct nasopharyngeal swabs should be tested as soon as possible after collection. If immediate testing is not possible, and to maintain best performance and avoid possible contamination, it is highly recommended the nasopharyngeal swab is placed in a clean, unused plastic tube labeled with patient information, preserving sample integrity, and capped tightly at room temperature (15–30°C) for up to 1 hour prior to testing. Ensure the swab fits securely within the tube and the cap is tightly closed. If greater than 1 hour delay occurs, dispose of sample. A new sample must be collected for testing.

TEST PROCEDURE

Allow the test device, test sample and buffer to equilibrate to room temperature (15–30°C) prior to testing.

- Remove test device from the sealed pouch just prior to the testing and lay on a flat surface.
- Invert the sample extraction tube and add 4 drops (about 100 µL) of test sample by squeezing the extracted solution tube into both sample wells (S).
- NOTE:** As shown in the diagram below it is important that the area marked in blue (base of the extraction tube) is the area that the operator should squeeze to expel the sample.
Squeezing near the top of the tube this could result in the dropper tip popping off.
- Wait for the colored band(s) to appear. The result should be read in 15 minutes. Do not interpret the result after 20 minutes.

INTERPRETATION OF RESULTS

For Flu A/B Test Strip

- POSITIVE:**
 - 1.1 Flu A Positive:** The presence of two lines as control line (C) and A test line within the result window indicates a positive result for Influenza A viral antigen.
 - 1.2 Flu B Positive:** The presence of two lines as control line (C) and B test line within the result window indicates a positive result for Influenza B viral antigen.

1.3 Flu A+B Positive:

The presence of three lines as control line (C), A test line and B test line within the result window indicates a positive result for Influenza A and Influenza B viral antigen.

2. NEGATIVE:

The presence of only control band (C) within the result window indicates a negative result.

3. INVALID:

If the control band (C) is not visible within the result window after performing the test, the result is considered invalid. Some causes of invalid results are because of not following the directions correctly or the test may have deteriorated beyond the expiration date. It is recommended that the specimen be re-tested using a new test.

For COVID-19 Ag Test Strip

1. POSITIVE:

The presence of two lines as control line (C) and test line (T) within the result window indicates a positive result.

2. NEGATIVE:

The presence of two lines as control line (C) and test line (T) within the result window indicates a positive result.

3. INVALID:

If the control line (C) is not visible within the result window after performing the test, the result is considered invalid. Some causes of invalid results are because of not following the directions correctly or the test may have deteriorated beyond the expiration date. It is recommended that the specimen be re-tested using a new test.

NOTE:

- The intensity of color in the test line region (T) may vary depending on the concentration of analytes present in the specimen. Therefore, any shade of color in the test line region (T) should be considered positive. Please note that this is a qualitative test only, and cannot determine the concentration of analytes in the specimen.
- Insufficient specimen volume, incorrect operating procedure, or expired tests are the most likely reasons for control band failure.

QUALITY CONTROL

A procedural control is included in the test. A red line appearing in the control line region (C) is the internal procedural control. It confirms sufficient specimen volume and correct procedural technique. Control standards are not supplied with this test. However, it is recommended that positive and negative controls are sourced from a local competent authority and tested as a good laboratory practice, to confirm the test procedure and verify the test performance.

LIMITATIONS

- The CLINITEST Rapid COVID-19 + Influenza Antigen Test is for professional *in vitro* diagnostic use and should only be used for the qualitative detection of Influenza A, Influenza B, and/or SARS-CoV-2 in nasopharyngeal (NP) swab specimens.
- The etiology of respiratory infection caused by microorganisms other than Influenza A, Influenza B, or SARS-CoV-2 cannot be established with this test.
- The CLINITEST Rapid COVID-19 + Influenza Antigen Test can detect both viable and non-viable Influenza and SARS-CoV-2 viral particles. The performance of the CLINITEST Rapid COVID-19 + Influenza Antigen Test depends on antigen load and may not correlate with cell culture performed on the same specimen.
- If the test result is negative and clinical symptoms persist, additional testing using other clinical methods is recommended. A negative result does not rule out the presence of Influenza A, Influenza B, and/or SARS-CoV-2 viral antigens in specimen, as they may be present below the minimum detection level of the test. As with all diagnostic tests, a confirmed diagnosis should only be made by a physician after all clinical and laboratory findings have been evaluated.
- Inadequate or inappropriate specimen collection, storage, and transport may yield false negative test result.
- Failure to follow the Test Procedure may adversely affect test performance and/or invalidate the test result.
- Although this test has been shown to detect cultured avian Influenza viruses, including avian Influenza A subtype H5N1 virus, the performance characteristics of this test with specimens from humans infected with H5N1 or other avian Influenza viruses are unknown.
- Performance characteristics for Influenza A were established when Influenza A/H3 and A/H1 were the predominant Influenza A viruses in circulation. When other Influenza A viruses are emerging, performance characteristics may vary.
- Positive and negative predictive values are highly dependent on prevalence. False positive test results are more likely during periods of low Influenza activity when prevalence is moderate to low. Positive test results do not rule out co-infections with other pathogens.
- For COVID-19 Ag Test Strip, the amount of antigen in a sample may decrease as the duration of illness increases. Specimens collected after day 10 of illness are more likely to be negative compared to a RT-PCR assay.
- For COVID-19 Ag Test Strip, positive test results do not differentiate between SARS-CoV and SARS-CoV-2. Negative results should be treated as presumptive and confirmed with an authorized molecular assay, if necessary, for clinical management, including infection control.

Meropenem	5 mg/mL
Tobramycin	2 mg/mL
Phenylephrine	20% (v/v)
Oxymetazoline	20% (v/v)
0.9% sodium chloride	20% (v/v)
A natural soothing ALKALOL	20% (v/v)
Bclomethasone	20% (v/v)
Hexadecadrol	20% (v/v)
Flunisolide	20% (v/v)
Triamcinolone	20% (v/v)
Budesonide	20% (v/v)
Mometasone	20% (v/v)
Fluticasone	20% (v/v)
Fluticasone propionate	20% (v/v)

6. Microbial Interference

To evaluate whether potential microorganisms in clinical samples interfere with the detection of the COVID-19 Ag Test Strip to produce false negative results, Each pathogenic microorganism was tested in triplicate in the presence of heat inactivated SARS-CoV-2 virus (2.3×10^2 TCID₅₀/mL). No cross reactivity or interference was seen with the microorganisms listed in the table below.

Microorganism	Concentration
Respiratory syncytial virus Type A	5.5×10^7 PFU/mL
Respiratory syncytial virus Type B	2.8×10^5 TCID ₅₀ /mL
Novel influenza A H1N1 virus (2009)	1×10^6 PFU/mL
Seasonal influenza A H1N1 virus	1×10^5 PFU/mL
Influenza A H3N2 virus	1×10^6 PFU/mL
Influenza A H5N1 virus	1×10^6 PFU/mL
Influenza B Yamagata	1×10^5 PFU/mL
Influenza B Victoria	1×10^6 PFU/mL
Rhinovirus	1×10^6 PFU/mL
Adenovirus 1	1×10^6 PFU/mL
Adenovirus 2	1×10^5 PFU/mL
Adenovirus 3	$5 \times 10^{7.5}$ TCID ₅₀ /mL
Adenovirus 4	1×10^6 PFU/mL
Adenovirus 5	1×10^5 PFU/mL
Adenovirus 7	2.8×10^6 TCID ₅₀ /mL
Adenovirus 55	1×10^5 PFU/mL
EV-A71	1×10^5 PFU/mL
EV-B69	1×10^5 PFU/mL

EV-C95	1×10^5 PFU/mL
EV-D70	1×10^5 PFU/mL
Mycobacterium tuberculosis	1×10^3 bacterium/mL
Mumps virus	1×10^5 PFU/mL
Varicella zoster virus	1×10^6 PFU/mL
Human coronavirus 229E	1×10^5 PFU/mL
Human coronavirus OC43	1×10^5 PFU/mL
Human coronavirus NL63	1×10^6 PFU/mL
Human coronavirus HKU1	1×10^6 PFU/mL
Human Metapneumovirus (hMPV)	1×10^6 PFU/mL
Parainfluenza virus 1	7.3×10^6 PFU/mL
Parainfluenza virus 2	1×10^6 PFU/mL
Parainfluenza virus 3	5.8×10^6 PFU/mL
Parainfluenza virus 4	2.6×10^6 PFU/mL
Haemophilus influenzae	5.2×10^6 CFU/mL
Streptococcus pyogenes	3.6×10^6 CFU/mL
Streptococcus agalactiae	7.9×10^7 CFU/mL
Streptococcus pneumoniae	4.2×10^6 CFU/mL
Candida albicans	1×10^7 CFU/mL
Bordetella pertussis	1×10^4 bacterium/mL
Mycoplasma pneumoniae	1.2×10^6 CFU/mL
Chlamydia pneumoniae	2.3×10^6 IFU/mL
Legionella pneumophila	1×10^4 bacterium/mL
Pooled human nasal wash	N/A

6. Mikrobielle Interferenz

Um zu beurteilen, ob potentielle Mikroorganismen in klinischen Proben den Nachweis mit dem COVID-19 Ag-Teststreifen stören und zu falsch negativen Ergebnissen führen, wurde jeder pathogene Mikroorganismus in Triplikaten in Gegenwart eines Hitze-inaktivierten SARS-CoV-2-Virus getestet ($2,3 \times 10^2$ TCID₅₀/ml). Mit den in der nachstehenden Tabelle aufgeführten Mikroorganismen wurde keine Kreuzreaktivität oder Interferenz festgestellt.

Mikroorganismus	Konzentration
Respiratorisches Synzytial-Virus Typ A	$5,5 \times 10^7$ PFU/ml
Respiratorisches Synzytial-Virus Typ B	$2,8 \times 10^5$ TCID ₅₀ /ml

6. Mikrobiel interferens

Først kunne evaluere om potentielle mikroorganismer i kliniske prøver interffererer med detektionen med COVID-19 Ag-teststrimlen og producere falsk negative resultater, blev hver patogene mikroorganisme testet i triplex ved forekomst af varmeinaktivert SARS-CoV-2-virus ($2,3 \times 10^5$ TCID₅₀/mL). Der sås ingen krydsreaktivitet eller interferens med mikroorganismene, der er opelistet i tabellen herunder.

Mikroorganisme	Koncentration
Respiratorisk syncytialvirus type A	$5,5 \times 10^7$ PFU/mL

6. Mikrobiell interferens

Før å vurdere om potensielle mikroorganismer i kliniske prøver forstyrrer deteksjonen i COVID-19 Ag-teststrimmen og gir falske negative resultater, ble hver patogeneske testet i triplikat med tilstedevarsel av varmedeaktivert SARS-CoV-2-virus ($2,3 \times 10^2$ TCID₅₀/ml). Det ble ikke sett noen kryssreaksjon eller interferens med mikroorganismene angitt i tabellen nedenfor.

Mikroorganisme	Konsentrasjon
Respiratorisk syncytialvirus type A	$5,5 \times 10^7$ PFU/ml
Respiratorisk syncytialvirus type B	$2,8 \times 10^5$ TCID ₅₀ /ml
Novel influenza A H1N1-virus (2009)	1×10^6 PFU/ml
Sesonginfluenza A H1N1-virus	1×10^6 PFU/ml
Influenza A H3N2-virus	1×10^6 PFU/ml
Influenza A H5N1-virus	1×10^6 PFU/ml
Influenza B-Yamagata	1×10^5 PFU/ml
Influenza B-Victoria	1×10^6 PFU/ml
Rhinovirus	1×10^6 PFU/ml
Adenovirus 1	1×10^6 PFU/ml
Adenovirus 2	1×10^5 PFU/ml
Adenovirus 3	$5 \times 10^{7,5}$ TCID ₅₀ /ml
Adenovirus 4	1×10^6 PFU/ml
Adenovirus 5	1×10^6 PFU/ml
Adenovirus 7	$2,8 \times 10^6$ TCID ₅₀ /ml
Adenovirus 55	1×10^6 PFU/ml
EV-A71	1×10^6 PFU/ml
EV-B69	1×10^6 PFU/ml
EV-C95	1×10^6 PFU/ml
EV-D70	1×10^6 PFU/ml

Mycobacterium tuberculosis	1×10^3 bakterie/ml
Kusmvirus	1×10^5 PFU/ml
Varicella zoster-virus	1×10^6 PFU/ml
Humant koronavirus 229E	1×10^5 PFU/ml
Humant koronavirus OC43	1×10^5 PFU/ml
Humant koronavirus NL63	1×10^6 PFU/ml
Humant koronavirus HKU1	1×10^6 PFU/ml
Humant metapneumovirus (hMPV)	1×10^6 PFU/ml
Parainfluensavirus 1	$7,3 \times 10^6$ PFU/ml
Parainfluensavirus 2	1×10^6 PFU/ml
Parainfluensavirus 3	$5,8 \times 10^6$ PFU/ml
Parainfluensavirus 4	$2,6 \times 10^6$ PFU/ml
Haemophilus influenzae	$5,2 \times 10^5$ CFU/ml
Streptococcus pyogenes	$3,6 \times 10^5$ CFU/ml
Streptococcus agalactiae	$7,9 \times 10^7$ CFU/ml
Streptococcus pneumoniae	$4,2 \times 10^6$ CFU/ml
Candida albicans	1×10^7 CFU/ml
Bordetella pertussis	1×10^4 bakterie/ml
Mycoplasma pneumoniae	$1,2 \times 10^6$ CFU/ml
Chlamydia pneumoniae	$2,3 \times 10^6$ IFU/ml
Legionella pneumophila	1×10^4 bakterie/ml
Poolet human neseskylning	I/R

INDEKS OVER SYMBOLER

	Se bruksanvisningen		Tester per pakke		Autorisert representant
	Kun til <i>in vitro</i> -diagnostisk bruk		Brukes før		Skal ikke gjenbrukes
	Oppbevares mellom 2–30°C		Lotnummer		Katalognr.

Revisjonsdato: 2022-07-22, B22577-01 Rev. A

atsitromysiini	5 mg/mL
meropeneemi	5 mg/mL
tobramysiini	2 mg/mL
fenyyliefrini	20 % (V/V)
oksimetatsoliini	20 % (V/V)
0,9-prosenttinen natriumkloridiiliuos	20 % (V/V)
ALKALOL natural soothing -nenähuuhde	20 % (V/V)
beklometasoni	20 % (V/V)
deksametasoni	20 % (V/V)
flunisolidi	20 % (V/V)
triamsinoloni	20 % (V/V)
budesonidi	20 % (V/V)
mometasoni	20 % (V/V)
flutikasoni	20 % (V/V)
flutikasonipropionaatti	20 % (V/V)

6. Testiä häiritsevät mikrobit

Sen arvioimiseksi, häiritsevät klinisissä näyteissä mahdollisesti esiintyvät mikro-organismit COVID-19 Ag -testiliuskan tunnistustointiaan niin, että testi tuottaisi virheellisiä negatiivisia tuloksia, kuten patogeenien mikro-organismi testattavalla kolme kertaa sisällytetynä näytteissä, joissa oli lämmöllä inaktivoitua SARS-CoV-2-virusta ($2,3 \times 10^2$ TCID₅₀/mL). Seuraavassa tulukossa esitetään tutkitut mikro-organismit, joiden ei havaittu aiheuttavan ristireaktiivisuutta tai häiritsevän testin toimintaa.

Mikro-organismi	Pitoisuus
RS-virus typpi A	$5,5 \times 10^7$ PFU/mL
RS-virus typpi B	$2,8 \times 10^5$ TCID ₅₀ /mL
uusi influensa A, H1N1-virus (2009)	1×10^6 PFU/mL
kausi-influensa A, H1N1-virus	1×10^5 PFU/mL
influenssa A, H3N2-virus	1×10^6 PFU/mL
influenssa A, H5N1-virus	1×10^6 PFU/mL
influenssa B Yamagata	1×10^5 PFU/mL
influenssa B Victoria	1×10^6 PFU/mL
rinovirus	1×10^6 PFU/mL
adenovirus 1	1×10^6 PFU/mL
adenovirus 2	1×10^5 PFU/mL
adenovirus 3	$5 \times 10^{7,5}$ TCID ₅₀ /mL
adenovirus 4	1×10^6 PFU/mL
adenovirus 5	1×10^5 PFU/mL
adenovirus 7	$2,8 \times 10^6$ TCID ₅₀ /mL
adenovirus 55	1×10^5 PFU/mL
EV-A71	1×10^5 PFU/mL

EV-B69	1×10^5 PFU/mL
EV-C95	1×10^5 PFU/mL
EV-D70	1×10^5 PFU/mL
Mycobacterium tuberculosis	1×10^3 bakteria/mL
sikotautivirus	1×10^5 PFU/mL
vesirokkovirus	1×10^6 PFU/mL
ihmiseni koronavirus 229E	1×10^5 PFU/mL
ihmiseni koronavirus OC43	1×10^5 PFU/mL
ihmiseni koronavirus NL63	1×10^6 PFU/mL
ihmiseni koronavirus HKU1	1×10^6 PFU/mL
ihmiseni metapneumovirus (hMPV)	1×10^6 PFU/mL
parainfluenssavirus 1	$7,3 \times 10^6$ PFU/mL
parainfluenssavirus 2	1×10^6 PFU/mL
parainfluenssavirus 3	$5,8 \times 10^6$ PFU/mL
parainfluenssavirus 4	$2,6 \times 10^6$ PFU/mL
